Answer and explanation	Syllabus content, outcomes and targeted performance bands
<p>Question 7 A</p> <p>Recall that μ and $E(X)$ are equivalent.</p> $E(X) = \sum xp(x)$ $= (1 \times 0.05) + (2 \times 0.15) + (5 \times 0.4) + (6 \times 0.2) + (8 \times 0.2)$ $= 5.15$ $P(X > 5.15) = P(x = 6) + P(x = 8)$ $= 0.2 + 0.2$ $= 0.4$	<p>MA-S1 Probability and Discrete Probability Distributions MA11-7</p> <p style="text-align: right;">Band 4</p>
<p>Question 8 A</p> <p>Method 1:</p> <p>Finding the points of intersection between the two curves gives:</p> $px^2 = qx^2 + r$ $px^2 - qx^2 - r = 0$ $(p - q)x^2 - r = 0$ <p>If there are no points of intersection, then $\Delta < 0$.</p> $\Delta = b^2 - 4ac$ $= (0)^2 - 4(p - q)(-r)$ $= 4r(p - q)$ $4r(p - q) < 0$ <p>$4r(p - q)$ is a negative value.</p> <p>If $r > 0$:</p> $p - q < 0$ $\therefore p < q$ <p>Hence, option A is the only option that represents these conditions.</p> <p>Method 2:</p> <p>A is correct. This can be found by checking each option by drawing two parabolas and assigning values for p, r and q. Substituting $p = 2$, $q = 3$ and $r = 1$ will describe a situation where both parabolas will not intersect.</p> <p>B is incorrect. The two parabolas will intersect if $p = 3$, $q = 2$ and $r = 1$.</p> <p>C is incorrect. The two parabolas will intersect if $p = -1$, $q = 1$ and $r = 0$.</p> <p>D is incorrect. The two parabolas will intersect if $p = 1$, $q = -1$ and $r = 0$.</p>	<p>MA-F1 Working with Functions MA11-9</p> <p style="text-align: right;">Band 5</p>

Answer and explanation	Syllabus content, outcomes and targeted performance bands
<p>Question 10 D</p> <p>Method 1:</p> <p>D is correct. Examining the behaviour of $y = f(g(-x))$ for both positive and negative values of x finds the following.</p> <ul style="list-style-type: none"> • When $x = 1$, $g(-x) = g(-1) > 0$. Hence, $f(g(-1)) > 0$, since $f(x) > 0$ for $x > 0$. • When $x = -1$, $g(-x) = g(1) > 0$. Hence, $f(g(1)) > 0$ for the same reason that $f(x) > 0$ for $x > 0$. • When $x = 0$, $g(0) > 0$. Hence, $f(g(0)) > 0$. <p>Therefore, the graph of $y = f(g(-x))$ must be above the x-axis for all values of x.</p> <p>Examining the behaviour of $y = f(g(-x))$ at the extremities finds that when $x \rightarrow -\infty$, $g(-x) = g(\infty) \rightarrow \infty$. Hence, $f(g(-x)) \rightarrow \infty$ since $f(x) \rightarrow \infty$ as $x \rightarrow \infty$.</p> <p>Therefore, the graph of $y = f(g(-x)) \rightarrow \infty$ as $x \rightarrow -\infty$.</p> <p>A and C are incorrect. The graphs exist below the x-axis.</p> <p>B is incorrect. When $x \rightarrow -\infty$, $f(g(-x)) \rightarrow 0$.</p> <p>Method 2:</p> <p>As $f(x)$ resembles $y = x^3$ and $g(x)$ resembles $y = e^x$:</p> $f(g(-x)) = (e^{-x})^3$ $= e^{-3x}$ <p>Therefore, This graph should behave like an exponential function in the form $y = e^{-3x}$. Option D best represents this information.</p>	<p>MA-F1 Working with Functions MA11-9, 12-10 Bands 5-6</p>

θ	47°	47.74°	48°						
$\frac{dL}{d\theta}$	-0.383 (negative)	0	0.133 (positive)						

Sample answer

Syllabus content, outcomes, targeted performance bands and marking guide

(continued)

Hence, $\theta = 47.74^\circ$ is a minimum turning point.

For this reason, the maximum possible length of L occurs when $\theta = 47.74^\circ$.

When $\theta = 47.74^\circ$:

$$L = \frac{3}{\cos 47.74^\circ} + \frac{4}{\sin 47.74^\circ}$$

$$\approx 9.86$$

Therefore, the maximum possible length of the whiteboard is 9.86 metres.

Note: Accept the final answer rounded up or down.

No marks are awarded for correct rounding.

To find the maximum length that the whiteboard can be carried around the corner, θ must be found that

minimises $L = \frac{3}{\cos \theta} + \frac{4}{\sin \theta}$.

Notice that the whiteboard will form an angle θ such that $0^\circ < \theta < 90^\circ$.

As the whiteboard enters from the bottom corridor, the angle θ will start towards its upper bound, 90° . As the whiteboard moves around the corner, θ will decrease towards its lower bound, 0° .

Entering the corridors:

(continues on next page)

Sample answer

Syllabus content, outcomes, targeted performance bands and marking guide

(continued)

Moving around the corner:

When θ is close to either the lower or upper bound, the length of the whiteboard is infinitely long. This is also represented when θ is considered as 90° or 0° in the expression $L = \frac{3}{\cos \theta} + \frac{4}{\sin \theta}$. That is, when $\theta \rightarrow 90^\circ$ or 0° , $L \rightarrow \infty$. However, in these situations, the whiteboard will be too long to make it around the corner.

Hence, the response should find the value of θ such that L is optimally long enough to still be able to turn around the corner.

Notice in the diagram that the value of θ for the whiteboard turning the corner will give the shortest possible length for L .

Hence, to find the maximum possible length of the whiteboard such that it can turn around the corner, the angle that minimises the function $L = \frac{3}{\cos \theta} + \frac{4}{\sin \theta}$ must be found.
