MATHEMATICAL METHODS (CAS)**  
**2008 Trial written examination 2 – Solutions – Multiple choice**

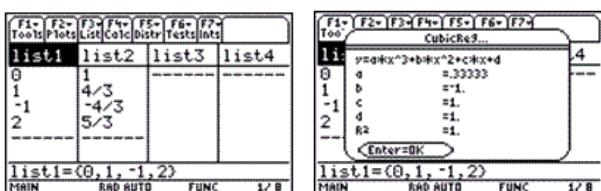

**SECTION 1**  
**Solutions**

- |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|
| 1. D  | 2. E  | 3. A  | 4. C  | 5. A  | 6. B  |
| 7. E  | 8. C  | 9. E  | 10. B | 11. B | 12. A |
| 13. D | 14. E | 15. B | 16. B | 17. A | 18. C |
| 19. A | 20. B | 21. B | 22. C |       |       |

**Question 1**

**Answer D**

Enter data into the calculator and choose cubic regression.

The exact answer is required.

$$y = \frac{1}{3}x^3 - x^2 + x + 1$$

$$3y = x^3 - 3x^2 + 3x + 3$$

**Question 2**

**Answer E**

$h(x)$  has factors  $x$ ,  $x(x - b)$  and  $(x - c)$ .

The coefficient of  $x^4$  is negative.

Since  $a > 0$ , the rule is  $h(x) = -ax^2(x - b)(x - c)$ .

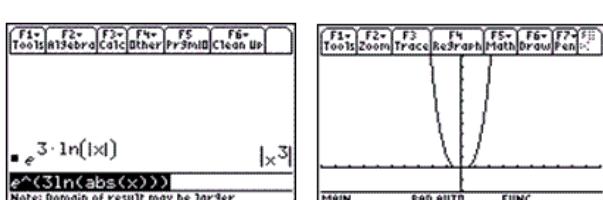

**Question 3**

**Answer A**

$$f(g(x)) = e^{3\log_e|x|} = e^{\log_e|x^3|} = |x^3|$$

The domain of  $f(g(x))$  is the same as the domain of  $g(x) : R \setminus \{0\}$ .

The range is  $R^+$ .

**Question 4**

$f: (-\infty, 3] \rightarrow R$  where  $f(x) = (x - 3)^{\frac{2}{3}} + 1$

$$\text{Let } y = (x - 3)^{\frac{2}{3}} + 1$$

Inverse swap  $x$  and  $y$

$$x = (y - 3)^{\frac{2}{3}} + 1$$

$$(y - 3)^{\frac{2}{3}} = x - 1$$

$$y - 3 = -(x - 1)^{\frac{3}{2}}, \text{ take the negative square root}$$

$$y = 3 - (x - 1)^{\frac{3}{2}}$$

**OR**

Solve  $x = (y - 3)^{\frac{2}{3}} + 1$  for  $y$  on the CAS

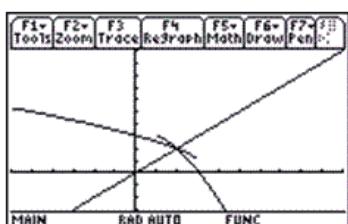

F1	F2	F3	F4	F5	F6	
Tools	Algebra	Calc	Other	Pr9M10	Clean Up	

```

solve(x=(y-3)^2/3+1,y)
y=3-(x-1)^3/2 and x ≥ 1 ►
...e(x=(y-3)^(2/3)+1,y)
MAIN DEG AUTO FUNC 1/30

```

$f: [1, \infty) \rightarrow R$ , where  $f^{-1}(x) = 3 - (x - 1)^{\frac{3}{2}}$

**Question 5****Answer A**

Solve the matrix equation to obtain the result

$$\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} \frac{8-b}{2a-1} \\ \frac{ab-4}{2a-1} \end{bmatrix}$$

**OR**

Determinant =  $2a - 1 \neq 0$

Hence there will be a unique solution for  $a \in R \setminus \left\{\frac{1}{2}\right\}$  and  $b \in R$

F1=	F2=	F3=	F4=	F5=	F6=
Tools	Algebra	Calc	Other	Pr3nt	Clean Up
rref	1 2 b				
	$\begin{bmatrix} 1 & 0 & \frac{-(b-8)}{2 \cdot a - 1} \\ 0 & 1 & \frac{a \cdot b - 4}{2 \cdot a - 1} \end{bmatrix}$				

rref([a,1,4;1,2,b])  
Main DEG HUTO FUNC 1/99

Note also that if:

$a = \frac{1}{2}$  and  $b = 8$ , there are infinite solutions (the solutions are identical)

$a = \frac{1}{2}$  and  $b \in R \setminus \{8\}$ , there is no solution (the solutions are inconsistent)

**Question 6****Answer B**

$$-h(2x - 4) = -h(2(x - 2))$$

The transformation from  $h(x)$  to  $-h(2(x - 2))$  involves

A reflection in the  $x$ -axis, a dilation by a scale factor of  $\frac{1}{2}$  from the  $y$ -axis and a translation

2 units right.

**Question 7****Answer E**

The rule will be of the form  $f(x) = a\sin(n(x - \varepsilon)) + k$ .

Amplitude = 3, therefore  $a = 3$ .

Translation down 2 units, therefore  $k = -2$ .

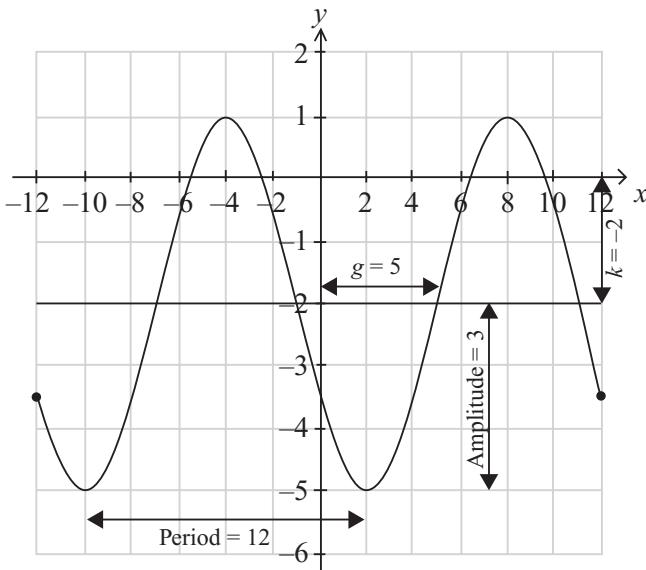

Phase shift,  $\varepsilon = 5$ .

$$\text{Period} = \frac{2\pi}{n}$$

$$12 = \frac{2\pi}{n}$$

$$n = \frac{2\pi}{12}$$

$$n = \frac{\pi}{6}$$

**Question 8****Answer C**

$\cos(x + \pi) = -\cos(x)$  (this can be seen from a unit circle or the graph of  $y = \cos(x)$ ).

Hence  $f(x + \pi) = -f(x)$

This can be verified using a CAS.

F1+	F2-	F3*	F4*	F5	F6*

```

■ Define f(x)=cos(x)      Done
■ f(x+π) = -f(x)        true
f(x+π)=-f(x)

```

MAIN RAD AUTO FUNC 2/99

**Question 9****Answer E**

Let  $x'$  and  $y'$  be the images of  $x$  and  $y$ , respectively, under  $T$ . The transformation of  $y = e^x$  to  $y = e^{-2(x+1)}$  involves:

$$\begin{aligned}x &= -2(x' + 1) \text{ and } y = y' \\x' + 1 &= -\frac{1}{2}x \\x' &= -\frac{1}{2}x - 1 \text{ and } y' = y\end{aligned}$$

**Question 10****Answer B**

$$e^{2x} + be^x + 1 = 0$$

$$\text{Let } e^x = p$$

$$p^2 + bp + 1 = 0$$

$\Delta < 0$  for no real solutions

$$b^2 - 4 = 0$$

$$\text{Hence } \{b : -2 < b < 2\}$$

Also there is no solution at  $b = 2$  as

$$e^{2x} + 2e^x + 1 = (e^x + 1)^2 = 0$$

$$e^x \neq -1$$

$$\text{Thus } \{b : -2 < b \leq 2\}$$

**Question 11****Answer B**

$$f(x) = \begin{cases} x^2 + 4x + a & \text{for } x \geq 0 \\ bx + c & \text{for } x < 0 \end{cases}$$

For  $f(x)$  to be differentiable at  $x = 0$ ,  $f(x)$  has to be continuous at  $x = 0$ .

$$x^2 + 4x + a = bx + c$$

$$\text{Hence at } x = 0, a = c$$

$$\text{Also } \lim_{x \rightarrow 0^-} f'(x) = \lim_{x \rightarrow 0^+} f'(x)$$

$$2x + 4 = b$$

$$\text{At } x = 0 \ b = 4$$

**Question 12****Answer A**

$$f(x+h) \approx hf'(x) + f(x)$$

$$f(x+h) - f(x) \approx hf'(x)$$

$$\begin{aligned}&\approx -0.1 \times \frac{2}{2x+1} \\&\approx -0.1 \times \frac{2}{3} = -\frac{1}{15}\end{aligned}$$

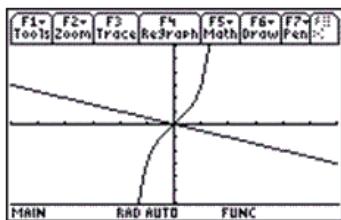

**Question 13****Answer D**

$$y = x^5 + 2x$$

$$\frac{dy}{dx} = 5x^4 + 2 = 2 \text{ at } x = 0.$$

The equation of the normal is

$$y = -\frac{1}{2}x.$$

**Question 14****Answer E**

$$\frac{x^2}{y} = 1, y = x^2$$

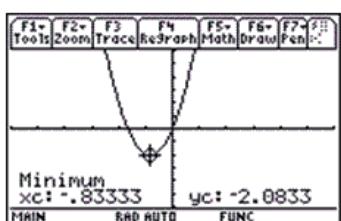

Substitute  $y = x^2$  into  $p$

$$p = 5x + 3y = 5x + 3x^2$$

$$\frac{dp}{dx} = 5 + 6x = 0 \text{ or } x = -\frac{b}{2a} = -\frac{5}{6}$$

$$x = -\frac{5}{6}$$

$p$  has a minimum value when  $x = -\frac{5}{6}$

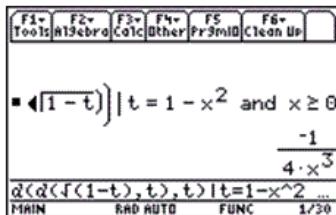

**Question 15****Answer B**

$$x = \sqrt{1-t}$$

$$v = \frac{dx}{dt} = -\frac{1}{2\sqrt{1-t}}$$

$$a = \frac{dv}{dt} = -\frac{1}{4(1-t)^{\frac{3}{2}}}$$

$$a = -\frac{1}{4x^3}$$

**Question 16****Answer B**

$$\text{average value} = \frac{1}{b-a} \int_a^b g(x) dx$$

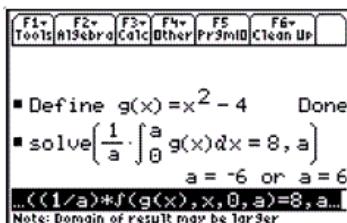

Apply the formula to this case

$$8 = \frac{1}{a-0} \int_0^a (x^2 - 4) dx$$

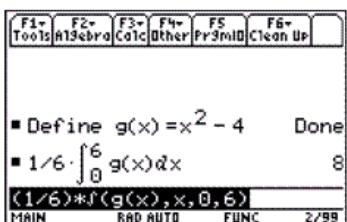

Solving for  $a$  gives the result

$$a = 6$$

Reject the negative solution because the domain of  $g$  requires that  $a > 0$ .

**OR**

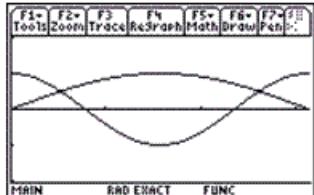

**Question 17****Answer A**

$y = \sin(x)$  is the top curve and  $y = \cos(2x)$  is the bottom curve.

$$\sin\left(\frac{\pi}{6}\right) = \cos\left(\frac{\pi}{3}\right) \text{ and } \sin\left(\frac{5\pi}{6}\right) = \cos\left(\frac{5\pi}{3}\right)$$

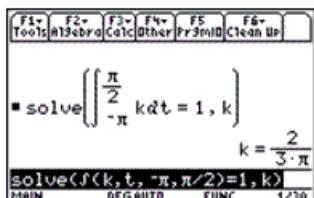

$$\text{Area} = \int_{\frac{\pi}{6}}^{\frac{5\pi}{6}} (\sin(x) - \cos(2x)) dx$$

**Question 18****Answer C**

For a probability density function,  $\int_{-\infty}^{\infty} f(t) dt = 1$ .

$$\text{Solve } \int_{-\pi}^{\frac{\pi}{2}} (k) dt = 1 \text{ for } k \text{ using CAS}$$

$$k = \frac{2}{3\pi}$$

**OR**

$$0 + \int_{-\pi}^{\pi/2} k dt = 1$$

$$[kt]_{-\pi}^{\pi/2} = 1$$

$$\left[ \frac{\pi}{2}k - (-\pi k) \right] = 1$$

$$\frac{3\pi}{2}k = 1$$

$$k = \frac{2}{3\pi}$$

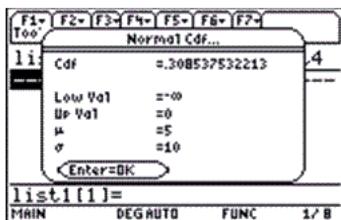

**Question 19****Answer A**

Let  $X$  be the percentage increase in the value of stocks.

$$X \sim N(\mu = 5, \sigma^2 = 10^2)$$

Stocks decrease in value if  $X < 0$ .

$$\Pr(X < 0) \approx 0.31$$

**Question 20****Answer B**

This is a problem of selection without replacement. Let  $S$  denote dialling Stewart's phone number.

$$\Pr(S', S', S) = \frac{7}{8} \times \frac{6}{7} \times \frac{1}{6}$$

Note from this pattern that the probability that the first, second, third, ..., eighth number

dialled is Stewart's number, is  $\frac{1}{8}$  each time.

**Question 21****Answer B**

$$\sum p(x) = 1$$

$$h + h^2 + \frac{1}{2} - h = 1$$

$$h^2 = \frac{1}{2}$$

$$h = \frac{1}{\sqrt{2}} \text{ (Reject negative solution as } h \in [0,1])$$

$$\mu = \sum x p(x)$$

$$= 0 + \left( 1 \times \left( \frac{1}{\sqrt{2}} \right)^2 \right) + \left( \sqrt{2} \times \left( \frac{1}{2} - \frac{1}{\sqrt{2}} \right) \right)$$

$$= \frac{1}{2} + \frac{\sqrt{2}}{2} - 1$$

$$= \frac{\sqrt{2}}{2} - \frac{1}{2}$$

$$= \frac{\sqrt{2} - 1}{2}$$

**OR**

Use CAS

MAIN DEG AUTO FUNC 2/30

**Question 22****Answer C****Method 1**

Consider, say, the 100<sup>th</sup> state.

$$S_{100} = T^{100} S_0 = \begin{bmatrix} 40 \\ 60 \end{bmatrix}$$

**Method 2**

The cardinal number of elements in this case is 100. The steady state matrix will therefore be of the form  $\begin{bmatrix} 100-x \\ x \end{bmatrix}$ . When the steady-state has

$$\text{been reached, } T \times \begin{bmatrix} 100-x \\ x \end{bmatrix} = \begin{bmatrix} 100-x \\ x \end{bmatrix}.$$

Solving the matrix equation for x gives the result  $x = 60$ ,  $100 - x = 40$

**Method 3**

If Method 2 above is applied to a general

transition matrix,  $T = \begin{bmatrix} 1-a & b \\ a & 1-b \end{bmatrix}$  and the steady state matrix is written as the proportions

$$\begin{bmatrix} 1-x \\ x \end{bmatrix}, \text{ the solution is}$$

$$x = \frac{a}{a+b} = \frac{0.3}{0.3+0.2} = 0.6.$$

As a proportion, the steady-state matrix is  $\begin{bmatrix} 0.4 \\ 0.6 \end{bmatrix}$ . However, there are 100 elements.

Using the cardinal numbers, the steady-state matrix is  $\begin{bmatrix} 40 \\ 60 \end{bmatrix}$ .

**The Mathematical Association of Victoria  
MATHEMATICAL METHODS (CAS)**  
**2008 Trial written examination 2: Solutions – Extended Answer Questions**

**SECTION 2****Question 1**

- a. Solve  $h^2 + \left(\frac{b}{2}\right)^2 = b^2$  for  $h$

$$h = \frac{\sqrt{3}b}{2}$$

[1M]

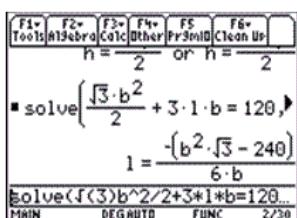

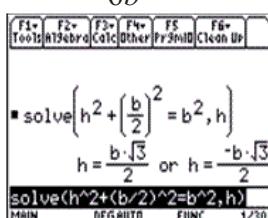

SA = area of the 2 triangles + 3 rectangles

$$bh + 3lb = 120$$

$$\frac{\sqrt{3}b^2}{2} + 3lb = 120$$

[1M]

$$l = \frac{240 - \sqrt{3}b^2}{6b}, 3 \leq b \leq 9$$

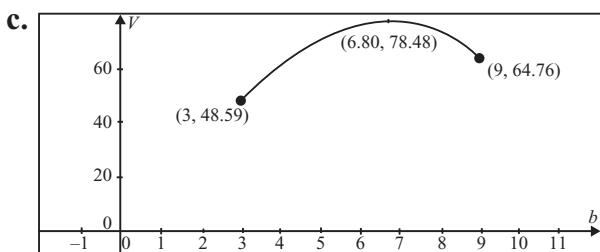

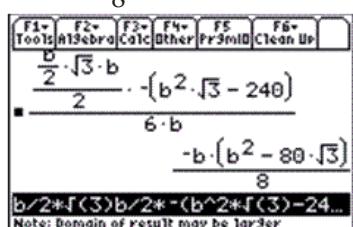

- b.  $V = \text{area of the triangle} \times \text{length}$

[1M]

$$= \frac{b}{2} \times \frac{\sqrt{3}b}{2} \times \frac{240 - \sqrt{3}b^2}{6b}$$

[1M]

$$= \frac{b(80\sqrt{3} - b^2)}{8}, 3 \leq b \leq 9 \text{ as required}$$

Correct shape [1A]

Correct turning point (6.80, 78.48) [1A]

Correct end points with closed circles (3, 48.59) and (9, 64.76) [1A]

d. The maximum occurs at the turning point not an end point.

$$\frac{dV}{db} = 10\sqrt{3} - \frac{3b^2}{8}$$

$$\text{Solve } 10\sqrt{3} - \frac{3b^2}{8} = 0 \text{ for } b$$

[1M]

$$b = \frac{4\sqrt{5}}{\sqrt[4]{3}} \text{ as reqd}$$

[1A]

$$h = \frac{\sqrt{3}}{2}b = 2\sqrt{5}\sqrt[4]{3} \text{ cm}$$

[1A]

$$l = \frac{240 - \sqrt{3}b^2}{6b} = \frac{4\sqrt{5}}{3^{3/4}} \text{ cm}$$

[1A]

Solve  $\frac{d}{db} \left( \frac{-b(b^2 - 80\sqrt{3})}{8} \right) = 0$

$b = \frac{-4\sqrt{5}\cdot 3^{3/4}}{3}$  or  $b = \frac{4\sqrt{5}}{3}$

Solve  $(d(-b*(b^2 - 80*\sqrt{3}))/8)$

$b = \frac{-4\sqrt{5}\cdot 3^{3/4}}{3}$  or  $b = \frac{4\sqrt{5}}{3}$

$\frac{\sqrt{3}\cdot 4\sqrt{5}\cdot 3^{3/4}}{3} = 2\sqrt{5}\cdot 3^{1/4}$

$\sqrt{3}/2 * (4*\sqrt{5} * 3^{3/4})/3$

$b = \frac{(b^2\sqrt{3} - 240)}{6\cdot b}$

$b = \frac{4\sqrt{5}\cdot 3^{1/4}}{3}$

$\frac{4\sqrt{5}\cdot 3^{1/4}}{3}$

$\Rightarrow b = 4*\sqrt{5}/3^{1/4}$

$$\text{e. } V = \frac{b(80\sqrt{3} - b^2)}{8} = \frac{80\sqrt{5}}{3^{3/4}} \text{ cm}^3$$

[1A]

$b = \frac{-b(b^2 - 80\sqrt{3})}{8}$

$b = \frac{4\sqrt{5}\cdot 3^{1/4}}{3}$

$\frac{80\sqrt{5}\cdot 3^{1/4}}{3}$

$\Rightarrow 81b = 4*\sqrt{5}/3^{1/4}$

$$\text{f. Average value} = \frac{1}{9-3} \int_3^9 \left( \frac{b(80\sqrt{3} - b^2)}{8} \right) db$$

$$= \frac{15(16\sqrt{3} - 9)}{4} \text{ cm}^3$$

[1M]

[1A]

$\int_3^9 \left( \frac{-b(b^2 - 80\sqrt{3})}{8} \right) db$

$\frac{15(16\sqrt{3} - 9)}{4}$

$\Rightarrow (b^2 - 80\sqrt{3})/8, b, 3, 9$

**Question 2**

a.  $N(t) = 200e^{-mt}$

Solve for  $m$ ,  $N(1) = 140$

$$140 = 200 e^{-m}$$

[1M]

**Question 3**

a.  $X \sim N(\mu = 712, \sigma^2 = 20^2)$

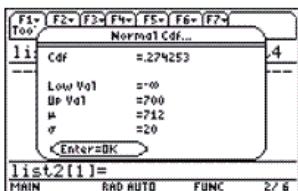

$$\Pr(X < 700) = 0.274$$

[1M]

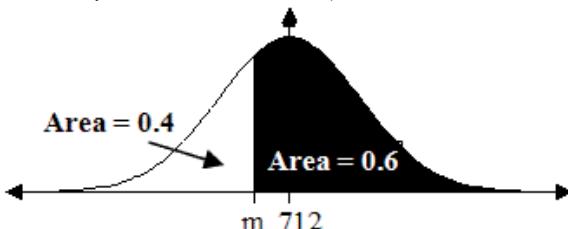

The proportion of cartons less than 700 g is 0.274.

[1A]

b.  $X \sim N(\mu = 712, \sigma^2 = 20^2)$

$$\Pr(X > m) = 0.6$$

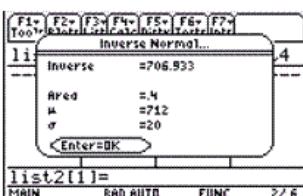

$$\Pr(X \leq m) = 0.4$$

$$m = 706.9$$

60% of cartons exceed 706.9 grams.

[1M]

[1A]

c.  $\Pr(X < 695 | X < 700)$

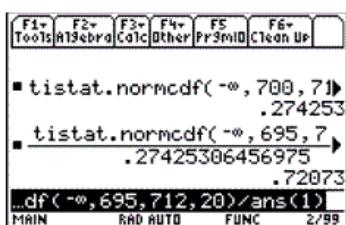

$$= \frac{\Pr(X < 695 \cup X < 700)}{\Pr(X < 700)}$$

$$= \frac{\Pr(X < 695)}{\Pr(X < 700)}$$

[1M]

$$\Pr(X < 695 | X < 700) = 0.721$$

[1A]

d. Let  $Y$  be the number of underweight cartons.

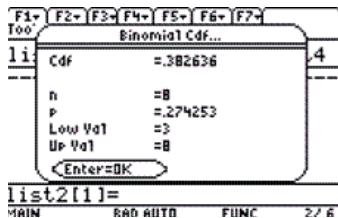

$$Y \sim Bi(8, 0.274)$$

[1M]

(The probability of a carton being underweight was found in part a. to be 0.274)

$$\Pr(Y \geq 3) = 0.383$$

[1A]

e. The transition matrix is as follows:

	Large today	Medium today
Large Tomorrow	0.45	0.75
Medium Tomorrow	0.55	0.25

The probability that Jamie orders medium-sized today and large-sized tomorrow is 0.75. [1A]

f. i.  $\Pr(L,L,M) = 0.75 \times 0.45 \times 0.55$

$$\Pr(L,L,M) = 0.1856$$

[1A]

ii. The  $n^{\text{th}}$  state is given by  $S_n = T^n \times S_0$

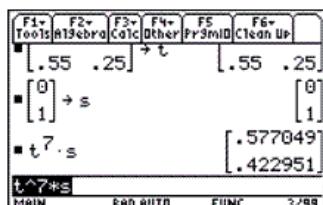

$$\text{This Tuesday, } S_0 = \begin{bmatrix} 0 \\ 1 \end{bmatrix} \begin{matrix} \leftarrow \text{Large} \\ \leftarrow \text{Medium} \end{matrix}$$

$$\text{Next Tuesday, } S_7 = T^7 \times S_0$$

$$S_7 = \begin{bmatrix} 0.5770 \\ 0.4230 \end{bmatrix}$$

[1M]

The probability of large-sized is 0.5770. [1A]

**Question 4**

a.  $2 \sin(x) \cos(x) = \frac{1}{2}$   
Using CAS

$$x = \frac{(12n + 5)\pi}{12} \quad [1A]$$

$$x = \frac{(12n + 1)\pi}{12} \text{ where } n \in \mathbb{Z} \quad [1A]$$

MAIN RAD AUTO FUNC 1/30

- b. i. A dilation of a factor of 3 from the  $x$ -axis  
 and a translation of  $\frac{\pi}{12}$  units to the left.  
 (The order does not matter.)

[1A]

[1A]

Correct shape

[1A]

Correct coordinates for the  $x$ -intercepts

$$\left(\frac{5\pi}{12}, 0\right) \text{ and } \left(\frac{11\pi}{12}, 0\right)$$

[1A]

Correct end points with closed circles

$$\left(0, \frac{3}{2}\right) \text{ and } \left(\pi, \frac{3}{2}\right)$$

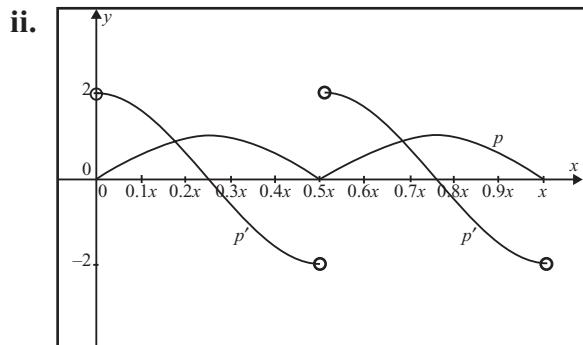

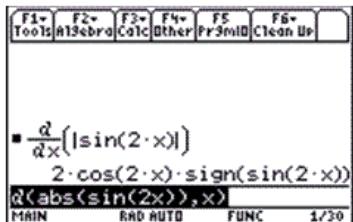

[1A]

Correct turning points

$$\left(\frac{\pi}{6}, 3\right) \text{ and } \left(\frac{2\pi}{3}, -3\right)$$

[1A]

c. i.  $p'(x) = \begin{cases} 2\cos(2x) & \text{if } \sin(2x) \geq 0 \\ -2\cos(2x) & \text{if } \sin(2x) < 0 \end{cases}$  [2A]

Correct graph for  $p$  [1A]  
Correct graph for  $p'$  [1A]

$x$ -intercepts of  $p'$ :  $\frac{\pi}{4}, \frac{3\pi}{4}$

Open circles

[1A]

iii.  $\int_{\frac{\pi}{4}}^{\frac{\pi}{2}} (\sin(2x) - 2\cos(2x)) dx$  [1M]

$$= 1.5 \text{ unit}^2$$
 [1A]
